

## **KDT in the emergency settings**

**Stéphane Auvin**

The ketogenic diet therapy (KDT), originally designed as a treatment for drug resistant epilepsy, has gained increasing attention in recent years for its potential use in emergency situations, such as status epilepticus. In case of emergency, the KDT is used by enteral administration as well as parenteral administration when enteral administration is not possible. The talk will review the potential benefits and challenges of implementing this dietary intervention in emergency neurological care. We will also discuss ongoing research efforts to collect more evidence-based data. Finally, we will also present the current recommendation for parenteral administration of the KDT.
